

TopoTherm

Veterinary Topographic Thermography

We Filmed The First Veterinary Thermal Surgery in History.

Heat vision: the ability to see inflammation and pain. Not only can you track pathology and healing down to the 0.01F degree, thermal allows you to see the foreign body and devitalized intestinal segment as soon as the abdomen is open. Detect and track tumor development and catch them earlier than ever before.

It's time to surpass human medicine. Visit vetxps.com/topotherm for more.
